Participant 2 : Code quality assessment

Sachin Singh (sachinsi@usc.edu)

Summary

The project boasts a highly impressive UI that effectively showcases experiences and incorporates a dark-themed navbar. However, a substantial portion of the project remains unfinished. The project's design deviates from the client's Canva design, and essential features such as user management and Instagram integration are absent. As a result, the project falls short of meeting the minimum quality standards.

Readability & Standards

The readability and adherence to naming standards are good. The code is straightforward and easy to comprehend.

Functionality

Function	**Assessment**	**Comparing to winning team**
A Landing page is linked from the client's website to this website.	Not Present	Present
User profile and login page and account management.	Not Present - User management is not present	Present
Picking up purchase history from Client's account.	Not Present	Present
Picking up instagram likes on clients posts from the user.	No facebook api linked	Present
Be responsive and work on all devices.	Using React which is responsive by itself	Present
Be built in a way that would be easier integrations with more clients (Third party websites)	Hard files for css hard coded, not scalable.	Not Present

Architecture

The backend is in an early stage of development, lacking any utilization of design patterns. The main imports necessary for the React app are present, with only the registration of the registerServiceWorker() function being imported additionally.

Remarks

The design does not follow the Canva design.

The project lacks inclusion of a majority of the functionalities.
