Participant 3 (Enigma): Code quality assessment

Rishabh Nevatia (nevatia.rishabh@gmail.com)

Summary

The project's user interface is quite simple. A significant portion of the submitted project remains unfinished. While it does include the front-end and client-server model, it lacks certain aspects such as a user management architecture, integration with Instagram, and a mechanism to track user purchase history. Despite including the front-end and client-server model, important components like user management, Instagram integration, and purchase history tracking are missing from the project.

Readability & Standards

The level of readability and compliance with naming conventions falls short of expectations. Filenames such as LD.js are particularly unintuitive.

Functionality

Function	**Assessment**	**Comparing to winning team**
A Landing page is linked from the client's website to this website.	Linked using file LD.js	Present
User profile and login page and account management.	Not Present - User management is not present	Present
Picking up purchase history from Client's account.	Not Present	Present
Picking up instagram likes on clients posts from the user.	No facebook api linked	Present
Be responsive and work on all devices.	Using React which is responsive by itself	Present
Be built in a way that would be easier integrations with more clients (Third party websites)	No infrastructure for scaling or flexibility.	Not Present

Architecture

The backend is currently in its initial developmental phase and hasn't yet incorporated any design patterns. It does attempt to implement a server-client design, which is a positive aspect. The essential imports for the React app are included, with the exception of the extra import related to the registration of the `reportWebVitals()` function.

Remarks

The design does not follow the Canva design.

The project lacks inclusion of a majority of the functionalities.
